TITLE: SUPPOSITORY CONTAINING CITRIC ACID OR SALT THEREOF

Abstract Text (2):

CONSTITUTION: A suppository contains a medicament and citric acid and/or a citrate, e.g. sodium citrate. The medicament is particularly a peptide hormone, e.g. insulin or calcitonin, enzyme, polysaccharide, carcinostatic agent or antibiotic which is, practically little or only insufficiently, absorbed by the conventional rectal or oral administration. The use of these medicaments as the suppository obtained in the form of a uniform mixture with citric acid and/or a citrate permits their effective absorption through a rectum and therefore their administration to a patient even without injection.
